The screenshot shows a web browser's developer console with a script editor window open for 'serverMonitorThread.script'. The script contains several lines of JavaScript code. An 'Error Info' dialog box is displayed over the code, indicating a runtime error: 'Can't evaluate the expression because the name "fiEnabled" hasn't been defined.' The error message is contained within a white box with a black border. To the right of the error message is a 'Go To' button with a right-pointing arrow icon. The script code visible includes:

```
local (addrdata = serverMonitorSuite.init ())
local (r
date.ge
if not d
  addr
if addr
  serv
  bundle //roll over the tables every night at midnight
  bundle //write most read sites reports from RCS's weblogStats if RCS is installed
  if defined (radioCommunityServerData.weblogStats.groups.default)
```
